A CVCV language

Suppose a language contains only morphemes that are made up of [CV] sequences. Here are a few examples:

'N'	*'the N'*	*'my N'*	
pa	paki	patoma	'tree'
limu	limuki	limutoma	'flower'
wanedo	wanedoki	wanedotoma	'pebble'
fosi	fosiki	fositoma	'leech'

(1)   What constraint rankings can we prove for this language using the following constraints?

       ONSET
       NOCODA
       NOEPENTHESIS
       NODELETION

(2)   What do you think would happen if a monolingual speaker of this language met an English speaker and tried to borrow the morpheme [bot] 'boat'?

(3)   How are your answers to (1) and (2) related?

Inspired by Smolensky (1996)
